# DAVID PILAT

SOFTWARE ENGINEER

Software Engineer with nearly 8 years building .NET backend services, APIs, payment and tax integrations, and serverless data pipelines for revenue-critical SaaS platforms. Consolidates legacy systems into shared services, builds privacy compliance into data pipelines, and improves reliability through CI/CD, structured logging, and safe deployment practices.

## EMPLOYMENT HISTORY

APR 2024 – PRESENT

**Software Engineer, Deep Sync, Redmond, WA (Hybrid)**

- Designed and built a centralized tax service integrating the Avalara API, replacing flat tax table lookups across 26 websites with one shared service.
- Built a company-wide privacy compliance service that checks datasets and pipelines against California Delete Act (DROP) requests and excludes matching individuals.
- Migrated 10 websites from CyberSource to Stripe with no payment downtime.
- Architected and deployed backend services and APIs for a consolidated platform, replacing 6 legacy applications.
- Modernized 3 legacy ETL pipelines from a proprietary C++ DLL and batch file system to event-triggered serverless functions on AWS Lambda with Python, improving processing speed 1.5x.
- Built a geospatial tool that generates ZIP code and carrier route polygons from lat/lon lists, replacing a legacy executable with a C# API hosted on AWS and called from Lambda, cutting that ETL stage from 3 days to 12–24 hours.
- Manage 86 websites and applications across C#, PHP/Laravel, and ColdFusion, plus 16 legacy ETL pipelines, supporting a $40M revenue stream.
- Built GitHub Actions CI/CD pipelines and added Serilog structured logging and runbooks, reducing manual release steps and shortening MTTR.
- Wrote versioned SQL migration and rollback scripts with verified backups to protect production data.
- Wrote unit and integration tests and refactored legacy C# modules into testable libraries.

SEP 2018 – NOV 2023

**Fullstack Software Engineer, Bizvalet, Bellevue, WA (Hybrid)**

- Built customer-facing maid-service SaaS features using C#, ASP.NET, and Entity Framework.
- Implemented drip email with Hangfire, increasing user retention by 10%.
- Built recurring orders with Hangfire, giving customers more flexible scheduling.
- Integrated Stripe, Google Calendar, and geocoding APIs.
- Designed a blogging platform with an admin interface and WYSIWYG editor.
- Created an embeddable cross-domain booking form in JavaScript.
- Designed and optimized SQL databases.

## INTERNSHIPS

JUN 2018 – AUG 2018

**Frontend Developer Intern, Bizvalet, Bellevue, WA (Hybrid)**

- Developed web features using HTML, CSS, and JavaScript for Seattle-area maid services.

## PROJECTS

- **Apollo:** Netflix-style web client for Jellyfin with a per-user match-score algorithm and a one-command Proxmox installer. React 19, TypeScript, Vite, TanStack Query.
- **Ruckus:** Self-hosted Discord alternative with guilds, text and voice channels, and screenshare across web and desktop. TypeScript.
- **Proxmox homelab:** Self-hosted media, DNS, monitoring, and personal apps, with a live status page at status.lonercorp.com.

## EDUCATION

JUN 2019

**Associate of Science in Computer Science, Edmonds College, Lynnwood, WA**

## SKILLS

**Backend**
C#, Python, .NET, ASP.NET, Entity Framework, REST APIs, Hangfire, Node.js, PHP/Laravel, ColdFusion

**Frontend**
TypeScript, JavaScript, React, Next.js, HTML/CSS

**Data**
SQL Server, PostgreSQL, NoSQL, ETL pipelines, Prisma

**Cloud and DevOps**
AWS Lambda, serverless, Azure, Docker, GitHub Actions, CI/CD, Serilog

**Integrations**
Stripe, Avalara, Google Calendar, geocoding APIs
